Project Title: Smart Waste Management System

Module Photographs:

Project Description:

Smart Waste Management System...

Smart Waste Management System is an IoT-based system designed to improve the collection and management of waste. Smart dustbins equipped with sensors detect the **waste level** inside the bin and send the information to a central system. When the bin reaches a certain level, an alert is generated so that the waste collection team can empty it on time.

The system helps **reduce overflowing garbage, improve cleanliness, optimize collection routes, and save time and fuel**. It can also support monitoring of multiple dustbins through a web or mobile application.

Key Features:

- Smart dustbin with waste-level sensors
- Real-time monitoring of bin status
- Automatic alert when the bin is full
- Location-based monitoring of dustbins
- Efficient waste collection and route planning
- Dashboard for monitoring and reporting

Objective:

To create an efficient and intelligent waste management system that keeps public areas cleaner while reducing unnecessary waste collection trips.
